

VICTIMIZATION AND VIOLENT OFFENDING

RESEARCH PROPOSAL: RESEARCH METHODS IN CRIMINAL JUSTICE

Presented by Zhaire Robinson

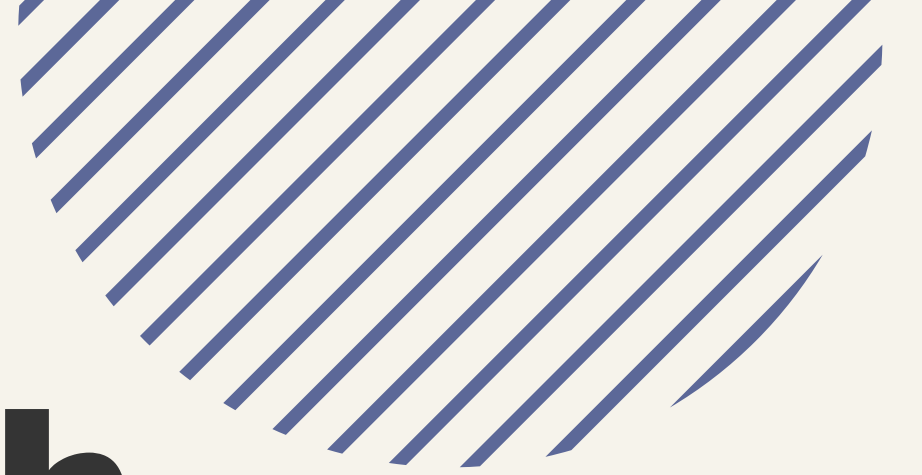

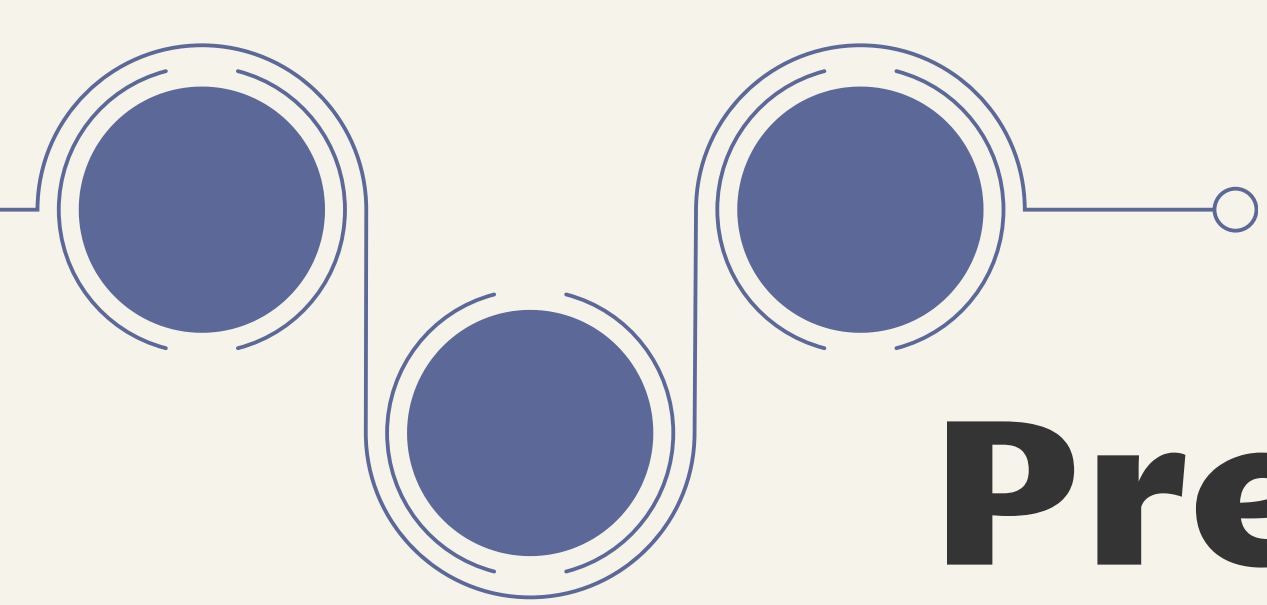

04/20/2026

Statement of the Problem

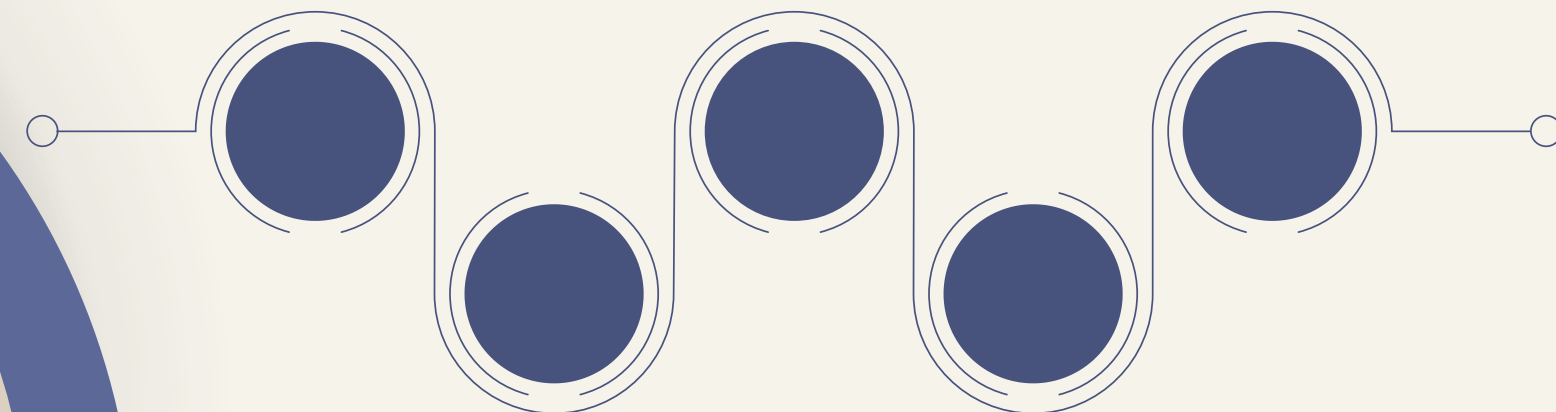

- Violence is still a major issue that affects both those who experience it and those who commit it.
- Research shows overlap between victim and offender roles
- Victimization includes: physical assault, bullying, threats
- Exposure to violence can lead to trauma
- Trauma may influence future behavior and decision-making
- Understanding this link is important for prevention

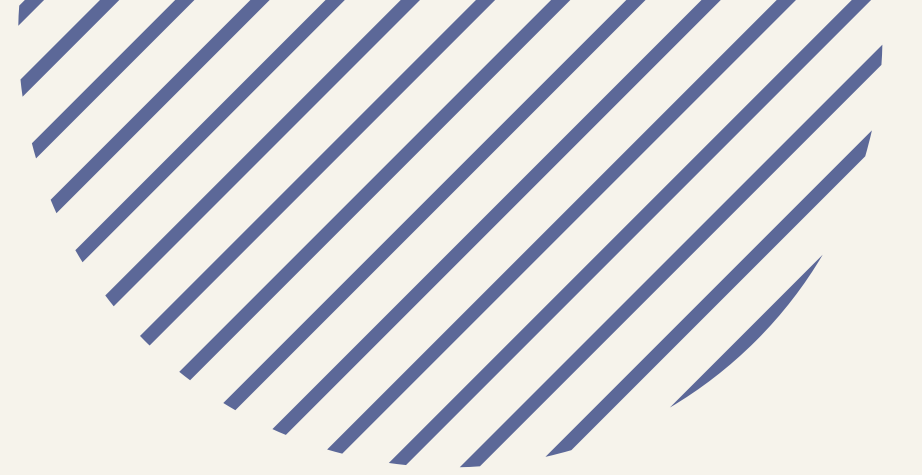

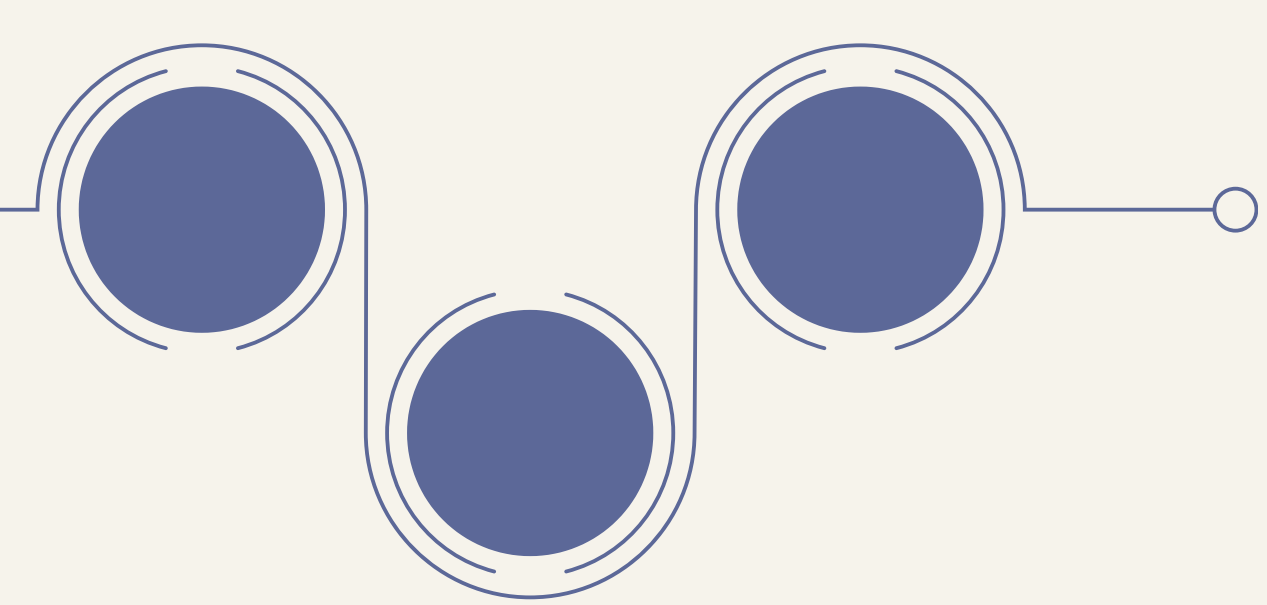

Previous Research

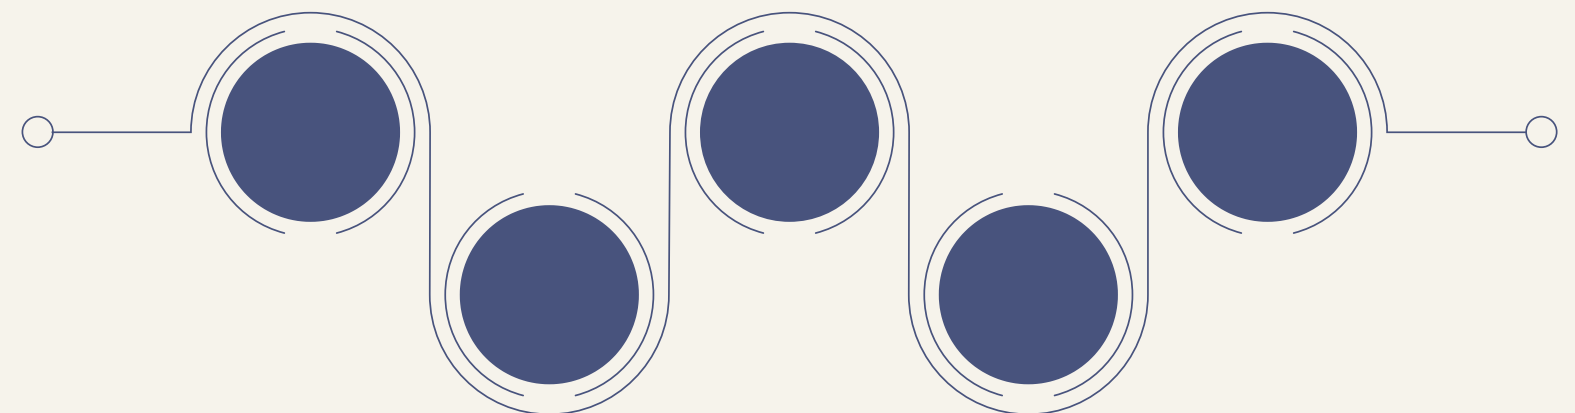

- Victim-offender overlap: individuals experience both roles
 - Jennings et al. (2012): strong relationship between victimization and offending
 - Lauritsen et al. (2004): offenders often have a history of victimization
 - There is a strong link between victimization and offending
- Fagan et al. (1986): early exposure increases violent behavior
 - Widom & Maxfield (2001): childhood abuse linked to later crime
 - Key factors: trauma, environment, learned behavior

Hypothesis

- People who experience violent victimization are more likely to commit violent acts.
-
- This study predicts a relationship between victimization and violent behavior
- Individuals who experience violent victimization → higher likelihood of offending
- Prior exposure to violence → increased risk of aggressive behavior
- Individuals without victimization → lower likelihood of offending

Measures

Independent Variable Violent Victimization

- Physical assault (hit, attacked)
- Bullying or repeated harassment
- Threats of serious harm

Measurement Types

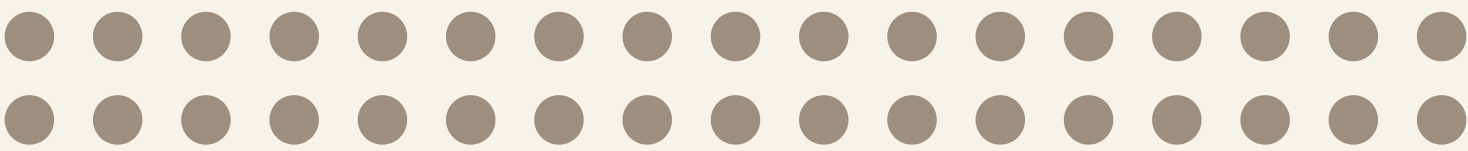

- Nominal (yes/no responses)
- Ordinal (Likert scale: never → often)

Independent Variable Violent Offending

- Physical fighting or attacking
- Threatening others
- Use of force to take something

Independent Variable

- Nominal (yes/no)
 - Ratio (number of times behavior occurred)
- 
-
