Annotated Bibliography

Downey, C., & Crummy, A. (2021). The impact of childhood trauma on children's wellbeing and adult behavior. *Journal of Pediatric Nursing*, 61, 167–173.

This article explains how childhood trauma affects both development and behavior later in life. The authors show that children who experience abuse, neglect, or violence often struggle with emotions, relationships, and mental health as they grow up. These early experiences can lead to problems like aggression, substance use, and other harmful behaviors in adulthood.

This article is important for my research because it shows how maladaptive coping starts early. When children experience trauma, they may not learn healthy ways to deal with stress, which can lead to negative behaviors later. This supports my topic by explaining how victimization can lead to offending over time.

Walker, D. (2021). Vicarious victimization, negative emotions, and maladaptive coping: Investigating the role of violent peers. *Violence and Victims*, 36(1), 45–65.

This article looks at how being exposed to violence indirectly can still affect a person's emotions and behavior. The author explains that even witnessing violence can lead to stress, fear, and anger. The study also shows that having violent peers can make these effects worse and increase the chances of negative behavior.

This article is useful for my research because it directly connects victimization to maladaptive coping. It shows that people may respond to emotional stress in unhealthy ways, like aggression. This supports my topic by showing how even indirect victimization can increase the risk of offending.

Turanovic, J. J., & Pratt, T. C. (2013). The consequences of maladaptive coping: Integrating general strain and self-control theories to specify a causal pathway between victimization and offending. *Journal of Quantitative Criminology*, 29(3), 321–345.

This article explains how victimization can lead to crime by focusing on stress and self-control. The authors show that trauma can cause negative emotions like anger and frustration. If a person has low self-control, they may deal with these emotions in harmful ways. The study finds that maladaptive coping is a key factor linking victimization to offending.

This article clearly explains the connection between trauma and crime. It demonstrates that maladaptive coping is a major reason why victims may become offenders.

Deadman, D., & MacDonald, Z. (2004). Offenders as victims of crime?: An investigation into the relationship between criminal behaviour and victimization. *Journal of the Royal Statistical Society: Series A*, 167(1), 53–67.

This article studies the relationship between victimization and criminal behavior. The authors found that people who commit crimes are often also victims of crime. This shows that victim and offender roles can overlap instead of being completely separate.

This article is useful in identifying the victim-offender overlap. It also connects to maladaptive coping because victims may respond to their experiences in negative ways, such as committing crimes.

Carlson, E. B., & Dalenberg, C. J. (2000). A conceptual framework for the impact of traumatic experiences. *Trauma, Violence, & Abuse, 1*(1), 4–28.

This article explains how trauma affects people's thoughts, emotions, and behavior. The authors describe how traumatic experiences can lead to long-term mental health issues like anxiety and difficulty managing stress. They also explain that people respond to trauma differently depending on their situation.

This article is beneficial in understanding how trauma can lead to maladaptive coping. People who experience trauma may not handle stress in healthy ways, which can lead to harmful behaviors. This supports the idea that victimization can influence future actions.
